

ABSTRACT

A method of generating documents. In one embodiment the method involves establishing an architecture for a set of rules to be used in documents that consist of a plurality of components and creating a dynamic document structure that can resolve to one or more instances of a document and that is configured to include one or more rules based on the architecture for a set of rules. The architecture for a set of rules may be established by creating a schema having a conditions element, a choose element, an iterators element, a functions elements, and an external interface element that is configured to be resolved into a value. The method may also be configured to create a static document structure that can be resolved to one or more instances of a document that includes at least some content that is determined before and some content that is unchanged during and after a resolution process.
